

H-zoneRF DEMO  
GUI  
User Guide  
V1.0

1. At first, please connect the MagicRF RFID Reader demo module with antenna.
2. Install USB2UART serial port driver of Silabs ([CP210x\\_VCP\\_Win\\_XP\\_S2K3\\_Vista\\_7.exe](#)).
3. With the USB cable, please connect the PC with RFID Reader DEMO module.
4. Open the DEMO GUI and the GUI will find all available serial port.

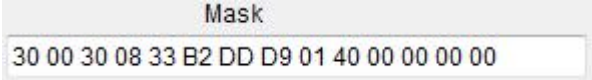

5. Find the right COM port and click CONNECT button, with the baud rate of 115200bps.
6. The default region is CHINA2, which is from 920MHz to 925MHz.
7. The default output power of QM100 DEMO is 30dBm. And the default output power of M100 DEMO is 26dBm.
8. Click  button, and continuous single inventory will be performed. The default time interval of continuous inventory is 100ms, which is controlled by GUI internal timer and should not be less than 50ms. After clicking  button, the button will change to .

9. The  button performs fast and finite inventory operation. The time interval of READ MULTI is controlled by the MCU counter of reader chip. The upper limit of READ MULTI counter is 65535. The  button can stop READ MULTI operation.
10. The  button starts frequency hopping operation. After jump to next channel and not find any signal which is larger than -65dBm, the normal operation will perform. If the signal level is higher than -65dBm, the current channel would not be chosen and jump to other channel. The  button

can stop frequency hopping operation.

11. On the  Tab, click the target tag EPC of the EPC table, the tag EPC will be shown in the  of  and the  of  , in order to perform SELECT operation and Read/Write/Lock/Kill operation.

12. For performing specific tag inventory, need to set up  后, check the SELECT checkbox

of  Tab. Then click READ SINGLE.

13. The write operation data length for tag memory should not exceed 16Words, i.e. 32Bytes/256Bits. The length is limited by internal SRAM of reader chip MCU.
